

A model of type theory supporting quotient inductive-inductive types

Ambrus Kaposi Szumi Xie
DCS 2021, Budapest

EFOP-3.6.3-VEKOP-16-2017-00002

Overview

A quotient inductive-inductive type (QIIT) signature is a context in the universal QIIT

All QIITs can be reduced to the universal QIIT

We show that the setoid model of type theory supports the universal QIIT

Examples of quotient inductive-inductive types (QIITs)

Examples of QIITs

$\text{Con} : \text{Set}$

$\text{Ty} : \text{Con} \rightarrow \text{Set}$

$\bullet : \text{Con}$

$- \triangleright - : (\Gamma : \text{Con}) \rightarrow \text{Ty} \Gamma \rightarrow \text{Con}$

$\text{U} : \text{Ty} \Gamma$

$\text{El} : \text{Ty} (\Gamma \triangleright \text{U})$

$\Sigma : (A : \text{Ty} \Gamma) \rightarrow \text{Ty} (\Gamma \triangleright A) \rightarrow \text{Ty} \Gamma$

$\text{eq} : \Gamma \triangleright \Sigma A B = \Gamma \triangleright A \triangleright B$

Other examples: Cauchy real numbers, partiality monad, intrinsic syntax for programming languages

What is a QIIT in general?

There is a QIIT called the *universal QIIT*

This is a syntax for a small type theory

A signature for a QIIT is a context in the universal QIIT

Example: **Nat** : U, **zero** : El **Nat**, **suc** : **Nat** \Rightarrow El **Nat**

All QIITs can be constructed from the universal QIIT

The universal QIIT in a model

A model of type theory supports the universal QIIT:

- notion of algebra
- notion of homomorphism
- there is an algebra (constructor)
- for every other algebra there is a homomorphism from the constructor to that algebra (recursor)
- the recursor is unique

The universal QIIT in a model

A model of type theory supports the universal QIIT:

- notion of algebra
- notion of homomorphism
- there is an algebra (constructor)
- for every other algebra there is a homomorphism from the constructor to that algebra (recursor)
- the recursor is unique

Rest of this talk:

- How to express all of these for a model of type theory
- Define a model which supports the universal QIIT
- How we implemented this in Agda

Specification of the universal QIIT in a model

Model of type theory

CwF with extra structure:

$\text{Con} : \text{Set}$

$\text{Ty} : \text{Con} \rightarrow \text{Set}$

$\text{Sub} : \text{Con} \rightarrow \text{Con} \rightarrow \text{Set}$

$\text{Tm} : (\Gamma : \text{Con}) \rightarrow \text{Ty } \Gamma \rightarrow \text{Set}$

$\Pi : (A : \text{Ty } \Gamma) \rightarrow \text{Ty } (\Gamma \triangleright A) \rightarrow \text{Ty } \Gamma$

$\text{lam} : \text{Tm } (\Gamma \triangleright A) B \rightarrow \text{Tm } \Gamma (\Pi A B)$

$\text{app} : \text{Tm } \Gamma (\Pi A B) \rightarrow \text{Tm } (\Gamma \triangleright A) B$

\vdots

A model supports the universal QIIT: algebra

$\text{Con} : \text{Set}$

$\text{Ty} : \text{Con} \rightarrow \text{Set}$

$\text{Sub} : \text{Con} \rightarrow \text{Con} \rightarrow \text{Set}$

$\text{Tm} : (\Gamma : \text{Con}) \rightarrow \text{Ty} \Gamma \rightarrow \text{Set}$

$\bullet : \text{Con}$

$- \triangleright - : (\Gamma : \text{Con}) \rightarrow \text{Ty} \Gamma \rightarrow \text{Con}$

$\text{U} : \text{Ty} \Gamma$

```

Recursor and uniqueness

The recursor in the empty context can be defined by recursion over the IIT

The recursor can be lifted to any context using a Π type where the domain is the context

Substitution laws and uniqueness of the recursor are proved by induction over the IIT

Agda still has not finished type checking the proof of uniqueness

Conclusion

Conclusion

A QIIT is a context in the universal QIIT

All QIITs can be reduced to the universal QIIT

We showed that the setoid model of type theory supports the universal QIIT

Future work

Equalities of sorts

Reduction rules of arbitrary QIITs constructed from the universal QIIT.
